2022 Update

RaDAR Primary Care Memory Clinics

Memory Clinic Teams

Memory Clinic locations

RaDAR primary care memory clinics in southeast Saskatchewan are a collaboration between primary health care teams and the *Rural Dementia Action Research (RaDAR)* Team at the University of Saskatchewan.

The first memory clinic was held in Kipling in 2017. Memory clinics are offered as a regular service by primary health care teams in the communities of Kipling, Weyburn, Rural West (Bengough and Radville), Carlyle, and Maryfield.

New Memory Clinic teams

We are pleased to welcome 3 primary care teams to the RADAR program. After completing orientation and training, the **Maryfield** team recently held their first memory clinic in September 2022.

The **Lampman** and **Esterhazy** teams are the latest to join and plan to hold

their first clinics in the coming months after taking part in

orientation and PC-DATATM training with Dr. Dallas Seitz. Funding to support involvement of the Esterhazy team is provided by a grant to Dr. Debra Morgan from the <u>Dementia Supports in Rural Saskatchewan</u> study. The study supports initiatives in Yorkton and surrounding communities that aim to increase social inclusion of people living with dementia.

About the RaDAR Memory Clinics

RaDAR memory clinics are offered by primary health care teams within the Saskatchewan Health Authority. Clinics are intended to provide coordinated care for patients and support for families, reducing travel and wait time for specialist appointments for those living in rural communities.

One-day memory clinics are held every 1-2 months or as needed by each team, with two patients assessed during the day (AM and PM). A short video of a Kipling memory clinic appointment is <u>available here</u>. Each half-day appointment begins with a team huddle, followed by a team meeting with the patient and family to discuss their concerns. Each team member then assesses the patient while the family meets with the Alzheimer Society and home care nurse/social worker. The appointment ends with a team huddle to review the assessments and a discussion with the patient and family to review recommendations and care plan.

Interprofessional care

Every memory clinic team includes physicians and/or nurse practitioners, home care nurses/social workers, occupational therapist, physiotherapist, and Alzheimer Society First Link Coordinator. Team configuration depends on the availability of health professionals. Teams use a shared EMR PC-DATATM template to guide their evaluation and to make decisions about the diagnosis, care planning, and recommendations to the patient and family.

Decision support

Assessment and management during clinic appointments are guided by PC-DATATM templates in the teams' EMR system. The templates consist of a separate section for each health professional to complete during the clinic appointment.

<u>PC-DATA™</u> (Primary Care Dementia Assessment and Treatment Algorithm) is a decision support tool for primary care professionals, based on Canadian guidelines, that was developed by Dr. Dallas Seitz (UCalgary) and adapted by RaDAR for memory clinic teams. Further decision support is provided through the RaDAR handbook, a comprehensive resource available to all teams that facilitates memory clinic functioning. The handbook includes templates for patient

letters, scripts to enable discussions about driving and other topics, an education manual with detailed information about tests and items in the PC-DATATM templates, Alzheimer Society brochures, and other materials.

Specialist support

Specialist support is available virtually from the Rural and Remote Memory Clinic at the University of Saskatchewan. The *Rural and Remote Memory Clinic* also offers remote interventions; patients and family members may be referred or self-refer and research participation is optional. More information about the remote interventions is *available here*.

Feedback about RaDAR Memory Clinics

Patient and family experiences with the RaDAR memory clinics have been highly positive. Patients and families appreciate the comfort and convenience of team-based care that is close to home and more easily accessible. They also report feeling supported and at ease.

"I very much appreciate access to the team in the community where my mom lives. This support is extremely helpful during this time. I feel I can call any of the team if I have questions." (Care partner)

"When my doctor asked me "How is your memory?" I said "Not that great", so he presented to me the idea of taking part in a clinic. I was very unsure about participating in a memory clinic. Over a period of time I began to feel that may be a good way to learn more about dementia. The team of health care workers made me feel at ease by

explaining each in their way some of the early signs of dementia that I am starting to see in myself. I feel that the time spent with them was very worthwhile." (Patient)

"I got a lot more on dementia and the Alzheimer's, we brought home a lot. We were given a lot on that, and just general information too. And you sort of have the feeling - well we were told too, if we had anything that we thought of after that we wanted to ask and didn't think of it, just to get ahold of them even, they were all really good." (Care partner)

Memory clinic team members value a team-based approach to diagnosis and care planning and recognize benefits to patients and families.

"Where I feel like things are more comprehensive is just having a better understanding of what the different team members can provide, as far as support or assessment for dementia. And just so that the actual assessment is more comprehensive as far as making sure that they're connected with more team members than they probably were prior to being involved with the memory clinics." (RaDAR memory clinic team member)

RaDAR Team's role in supporting RaDAR Memory Clinics

Clinical and operational guidance

Training with PC-DATA[™] developer Dr. Dallas Seitz is provided to each primary health care team before implementing a memory clinic. Teams also receive an orientation to standardized clinic processes and tools in the RaDAR handbook.

Shadowing and peer mentorship opportunities are available to new memory clinic teams with colleagues in nearby memory clinics. Clinical guidance is also provided by Kipling nurse practitioner Jeanie Daku and operational support is offered in all clinics by RaDAR team member Chelsie Cameron. RaDAR also holds workgroup meetings with teams in the implementation phase to address issues in the early stages, and ongoing check-in meetings with PHC facilitators and managers.

"It's all laid out for you how you set it up and how you do it, so that makes it easier to start a clinic in a town with the support that you get... So, that makes it maybe not quite so daunting of a task." (RaDAR memory clinic team member)

Continuing education

RaDAR regularly offers continuing education webinars with specialists and other experts on subjects related to dementia care. Webinar topics are often suggested by the teams. Examples of past topics include differential diagnosis, medications used in dementia management, capacity and competency, and end of life issues in advance dementia.

Resources

To ensure memory clinic teams have the necessary resources for operation, RaDAR offers funds for purchasing equipment such as laptops, conference phones, and testing materials, as well as assists with the cost of training and travel for health professionals.

Dementia Working Group

The Dementia Working Group mandate is to improve public awareness and share initiatives in dementia care in terms of what is working and opportunities for improvement. The group also supports RaDAR in sustaining and spreading the memory clinics. Group members include SHA leadership, health professionals, the Alzheimer Society of Saskatchewan, and RaDAR.

Role of the First Link Coordinator in RaDAR Memory Clinics

Objective: To examine the role and impact of including a First Link Coordinator in RaDAR memory clinics.

Methods

- Semi-structured telephone interviews with 3 First Link Coordinators serving 4 RaDAR memory clinic teams
- Alzheimer Society of Saskatchewan e-Tapestry database data comparing RaDAR Memory Clinic, self, and direct referrals from primary care professional

Preliminary findings

First Link Coordinator Interview Themes

1. Benefits to patients & families of FLC involvement

- Team approach provides a better experience; team shares information on clinic day
- Meeting face-to-face establishes bond with FLC; makes follow-up more comfortable and opens doors to further support

2. Benefits to memory clinic and team members

- FLC has unique role; fills a gap in providing emotional support, directing to services; dementia support is what they do
- Other team members can focus on their unique contributions
- Coordinator involvement shows team FLC role & benefits

3. Benefits to ASOS, First Link Program, and First Link Coordinators

- Relationships with team means FLC can refer other patients or contact team members about clinic patients
- FLC involvement validates and raises awareness of FLC role
- Mutual learning among team members from different disciplines is highly valued

Alzheimer Society e-Tapestry Database

- 127 clients were referred to ASOS from Dec 2017 – Dec 2021(42% spouses, 33% children, 17% PLWD, 8% other).
- Clients: 38% female, 23% % male; sex missing for 40%
- We compared memory clinic (n = 49), self (n = 25), and direct referrals from primary care professionals in the same area as the memory clinics (n = 53).
- Statistically significant (p < 0.05) differences between memory clinic clients and self/direct referrals included:
 - Memory clinic clients contacted sooner after referral than direct referrals (75% same day or within 3 days)
 - Longer duration of first contact for memory clinic clients (76% had 3-4 hour contact vs. 15-90 minutes)
 - More in-person contacts for memory clinic clients (85% vs. 15% for selfreferral, 6% for direct referral)
- No differences in number of completed contacts or number of topics discussed at first contact

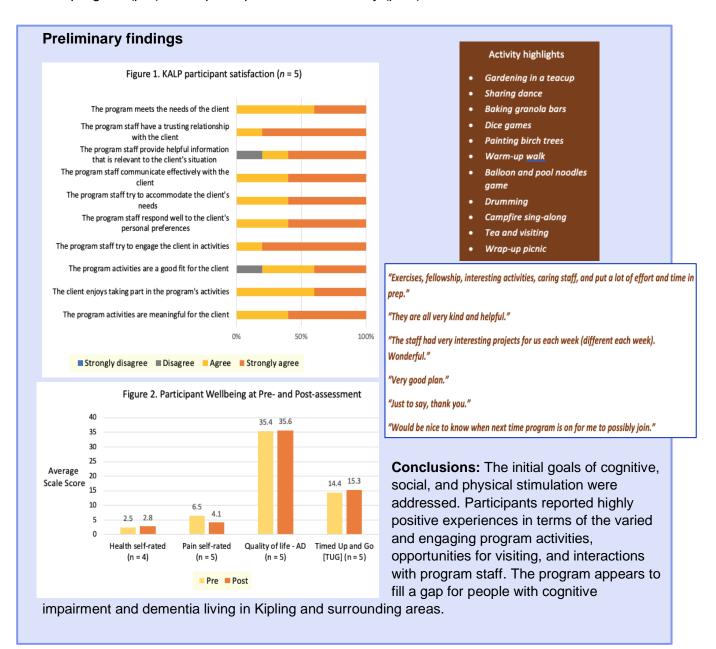

Conclusions: Together these findings provide evidence of the value of an embedded First Link Coordinator as a core team member in RaDAR primary-care based memory clinics.

Formative Evaluation of the Kipling Active Living Program

Objective: To conduct an evaluation of the Kipling Active Living Program during the initial stages of the 8-wk program to determine whether short-term outcomes are meeting expectations.

Methods

- Self-report questionnaire completed by 5 participants
- Participant well-being assessment completed by 7 participants on the first day of the 8-wk program (pre) and 5 participants on the last day (post)

Environmental Scan of Services and Supports

Objective: To identify and describe programs and services for older adults in RaDAR memory clinic communities and surrounding areas.

Methods

 Focus group with health care professionals and managers; review of secondary sources of information; systematic internet search

Preliminary findings

- Most programs and services fell into the Social & Leisure Activities or General Support & Referrals categories, and were self-referral or otherreferral, and were provided locally.
- Nearly half were free to access and were available remotely, and nearly 20% were volunteer-based.
- 17 programs were related to dementia, most of which (10/17) were provided by the Alzheimer Society.

Results: 43 Programs & Services Across 7 Categories 3-5

Program & Service Types (n)	Available to all communities remotely	Available in-person in the communities of						
		*Kipling	*Weyburn	*Radville	*Bengough	*Carlyle	Wawota, Kennedy, Kenosee Lake, Manor	*TOTALS
Social & Leisure Activities (n=14) • counselling, relationship such as senior centres, libraries, coffee clubs, activity programs	n=3	n=3	n=2	n=2	n=2	n=2	n=5	N=19

^{*}Total N's in this column include some duplicate service types offered in-person within multiple communities (e.g., SE Regional Public Libraries)

*Locations of RaDAR memory clinics

Next steps: To identify

unmet service needs and barriers to accessing services among people with dementia and/or their family caregivers, to help guide program interventions, inform decision makers, and enhance the participation of people with dementia and their families within their communities.

Care Partner Service/Support Use and Experiences

Objective: To examine service/support use and experiences among family care partners participating in an initial RaDAR memory clinic assessment of their family member.

Methods

• On the day of memory clinic assessment, semi-structured interviews with 28 care partners and collection of information from 22 patients (age, sex, cognitive and functional scores)

Preliminary findings

Participant characteristics

- Of the 28 care partner participants, 61% were female and average age was 64 years
- Of the 22 patient participants, 73% were female and average age was 80 years

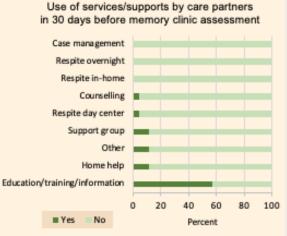

Use of services/supports by care partners

 Although most <u>care partners</u> reported using at least one service/support (67%) for themselves in the 30 days prior to the memory clinic assessment, the service accessed most often was education/ training/information (57%). Very few carers had used respite, support groups, or home help [graph].

Experiences with services/supports

- Many care partners (71%) identified potentially beneficial services/supports they had not yet received. These included information/education, support group, housecleaning/yardwork, home care or bathing assistance, and meal preparation.
- Carers' experiences with services/supports they had received prior to memory clinic assessment were highly positive. They appreciated service providers' prompt attention and being kept informed of the status of their family members' care and health.

Carers (N = 28)	n (%) or SD, range		
Sex			
Female	17 (61)		
Male	11 (39)		
Age mean (SD, range)	63.7 (12.7, 37-85)		
Relationship to family member			
Spouse	11 (39)		
Adult child	14 (50)		
Other	3 (11)		
Patients (N = 22)	n (%) or SD, range		
Sex	_		
Female	16 (73)		
Male	6 (27)		
Age mean (SD, range)	79.7 (10.0, 41-89)		
Cognitive and functional score mean (SD, range)			
MMSE	23.5 (4.1, 13-29		
	16.7 (5.2, 7-24		
MoCA			
MoCA FAQ	14.2 (9.3, 0-28		

Next steps: Continue to collect 1-month follow-up data; examine effect of memory clinic participation on care partners' service/support use, experiences, and self-efficacy.
